Notes on tables and data quality

- Percentages do not always add up to 100, because of rounding.
- A more detailed classification of body parts exists for HASS/LASS. This is given in Annex 2.
- Up to four body parts and three injuries per body part are recorded per victim. This means that there are more injuries or body parts than victims. This also applies to the items involved in the accidents.
- Articles are recorded here as being 'involved' in an accident; this does not imply that they caused it.
- Home and Leisure cases do not include accidental deaths.
- The national estimates are based on sample accident frequencies.
- The national estimates are related to 95 per cent confidence limits.

Effects on data quality of new software in 2000

It has not been possible to overcome the effects of software errors in two particular instances as noted below:

Accident Date and Accident Day fields

Prior to the introduction in the latter part of 2000 of a new hospital data entry system ('HASS3 Front End system') around 3% of accident dates were unknown for genuine reasons (for example, the case detail came from medical records which did not contain this information). The HASS3 Front End did not allow clerks to enter an unknown date of accident (so clerks in most cases will have made the assumption that Accident Date = Attendance Date, and in the great majority of cases this will have been an accurate assumption). However there is no practical way to identify which records were affected in this way, nor which of these affected records have an incorrect date because of this assumption, and what the date should have been.

Since Accident Date for every record is potentially suspect, the Accident Date for all records for all three years 2000-2002 has been set to 'Unknown'. Users will need to refer to 1999 for data on accident date distributions. Date of Attendance at hospital was not affected by these errors and is available for the three years 2000-2002.

The Accident Day field is also compromised, since it is determined by Accident Date, and similarly has been set to unknown for all records for the three years.

Age in Months

The HASS 3 Front End did not allow Age in Months to be entered as unknown if Age in Years is known (in cases where age was entered, instead of entering Date of Birth and age being calculated from this). So a similar situation exists here as for Accident Date, but in this case it is possible to narrow down to a fairly small subset those records that have been affected i.e. to those records where Date of Birth was not entered.

For all such cases in the three years 2000-2002 where age was not calculated from Date of Birth, Age in Months has been set to 'unknown'. This affects a relatively small proportion of records, since Date of Birth was known and used for over 95% of accident victims.

More information

If you are a manufacturer or researcher or are concerned with consumer safety in any way, detailed computer analyses of the HASS and LASS data are available. Samples can be extracted from the database according to any combination of data required, for example by age of patient, product involved or injury sustained.
